

For immediate release

**Cartier Intersects 11.5% Zn, 0.2% Cu, 44.2 g/t Ag
and 2.0 g/t Au over 0.6 m on the MacCormack Property**

Val-d'Or, November 25, 2014 - Cartier Resources Inc. (TSX-V: ECR) ("Cartier") announces that it has intersected massive sulphides grading up to **11.5% Zn, 0.2% Cu, 44.2 g/t Ag and 2.0 g/t Au over 0.6 m** in its most recent drill program on the [MacCormack Property](#), situated 25 km north-north west of the Bousquet – LaRonde mining camp infrastructures, near Malartic in the Abitibi.

The objective of this drill program was to test the lateral and depth continuity of the volcanogenic massive sulphide (VMS) mineralisation intersected in Cartier's 2009 drill program. All three new holes intersected massive sulphides that outline a zone that is 180 m long by 80 m vertical and is still open laterally and at depth ([Figure](#)).

Table 1: Drill results of massive sulphide intersections

Drill Hole	From m	To m	Length* m	Zn %	Cu %	Ag g/t	Au g/t
MC-14-10	211.4	211.8	0.4	7.1	0.2	4.1	0.1
MC-14-11	233.8	234.3	0.5	1.9	0.9	24.3	0.3
MC-14-12	215.4	216.0	0.6	11.5	0.2	44.2	2.0

* Lengths measured along core axis.

This VMS zone is situated at the contact of two types of rhyolite facies that are highly altered with chlorite and sericite. The geological, geochemical and geophysical characteristics shows that the continuity of the [favorable contact](#) over a 3 km strike length on the property.

« Having met all the objectives of the recent program, the next step is to continue drilling along the projected extension of the mineralisation at depth and laterally. Our focus is on the geometric vectors that will lead us to thicker intersections of massive sulphides » commented Philippe Cloutier, President and CEO.

Quality Assurance / Quality Control
